A proposal for Innovation Cup Cebu 2026 under SDG #3: Good Health and Well-being

3 GOOD HEALTH AND WELL-BEING

Problem Statement

Maintaining good health and fitness is one of the key ingredients of living a good life. Healthy body, healthy mind, healthy soul. As the saying goes, we can't pour from an empty cup. If we can't rely on our own bodies and well-being, it becomes difficult to show up for others: our families, our friends, and for ourselves.

Despite this, access to health and wellness guidance that is culturally relevant, affordable, and practical for Filipino students is limited. Having access to health and wellness advice that isn't "*Western-coded*" and tailor-made for your average (most likely broke) Filipino college student is incredibly difficult to find. It's hidden behind app paywalls that we can't afford, the messy UIs of search engines, fitness websites, and generalist AI chat agents that spit out advice that works for people across the ocean.

What's even more discouraging is that most nutrition and workout plans online assume abundance: that you have access to specific foods, certain equipment, or time flexibility.

This creates an implicit prerequisite to being healthy.

"If I can't afford x, and don't have access to y, why even bother trying to exercise?"

When health feels inaccessible, it becomes easy to disengage entirely and to give up.

People think that being healthy and living an active lifestyle comes from getting personalized workout plans from people on Instagram or TikTok, when in reality, for most people, the best lifestyle is the one you can sustain and make your own.

The problem is clear:

How can health and fitness be made less confusing, more personalized, more welcoming, and more sustainable to your average student?

Target Users / Beneficiaries

The primary users who may benefit the most from our product are individuals who want to improve their overall lifestyle. Whether it be losing weight, gaining muscle, or becoming more mindful with one's diet, Jim Jam is for those who want to get started with their fitness journey without getting overwhelmed and intimidated by "requirements" and "recommendations" to get started.

The main group we aim to target is college and senior high school students with access to phones and internet connections. These users often face tight budgets, inconsistent schedules, and limited access to fitness facilities. A secondary target group includes early-career professionals and working individuals who want to adopt healthier habits but feel overwhelmed by existing fitness and nutrition tools.

Some Pain Points We've Identified

Pain Point	Description
Western-coded advice	Most fitness and nutrition content assumes Western diets, food availability, and gym culture, making it feel alien or impractical for the average Filipino student learning about fitness.
Assumption of abundance	Existing apps and plans implicitly assume access to specific foods, supplements, kitchen equipment, or gym machines, which discourages users who lack these resources.
Paywalls and pricing mismatch	Many health apps lock meaningful personalization behind subscription fees that are unrealistic for students or fresh grads.
Fragmented tools	Users juggle multiple apps (calorie trackers, workout logs, AI chatbots, fitness trackers) that don't talk to each other, creating friction fatigue when it comes to making decisions.
Generic AI advice	General-purpose AI chat agents give technically correct advice but are context-blind, ignoring budget, culture, location, and sustainability.
Overwhelm and guilt	Health is framed as an all-or-nothing pursuit. If users can't "do it right," they feel like there's no point in doing it at all.
Quantified Shame	Students and newbies may avoid tracking "unhealthy" choices or going to the gym to escape social judgment or the "quantified shame" from strict, algorithm-driven targets.

Our One-Sentence Solution

jim jam!

Jim Jam! is an intelligent, student-friendly fitness and nutrition app that gives culturally relevant, budget-aware, and sustainable health guidance by adapting to what users already eat, where they live, and how they realistically live day-to-day.

Proposed MVP

The users download the "Jim Jam" app and create an account. During user onboarding, they complete an initial profiling including basic physical information (height and weight), goals, intent, location, and general lifestyle constraints. These parameters are configurable by the user and evolve as the app learns from user behavior.

The app contains three main sections:

Jim (AI Fitness Companion)

- **Role:** Helps users log workouts, reflect on previous activity, and receive suggestions tailored to their history and physical capabilities.
- **Analogy:** A gym bro there to keep you accountable.
- **Capabilities:** Suggests exercises, achievable milestones, and nearby places to work out. Can integrate with activity-tracking apps like Strava.

Jam (AI Nutrition Companion)

- **Role:** Helps users track meals and eating habits (who also makes you think twice about reaching for that extra piece of ensaymada).
- **Capabilities:** Provides food suggestions based on what users already eat, estimates calorie intake using user-uploaded food images (via the LLM's capability), and recommends small, realistic dietary improvements grounded in past behavior.

You

- **Role:** Provides analytics and insights derived from workout history, dietary patterns, and user goals.
- **Key Feature:** Instead of raw numbers, it highlights trends, progress, and areas worth exploring. This helps users understand themselves better over time.

Proposed Revenue Model

Jim Jam operates on a **freemium model**. The free tier uses accessible AI models with limits on message volume and analytical depth, allowing users to experience the core functionality without cost.

Students are entitled to a **free one-month premium subscription** upon verification of student status, optionally paired with a survey to help improve the product.

Additional revenue options include:

- **Token-based usage**, where users purchase message credits depending on the AI model used.
- **Subscription plans**, which allow daily interaction with Jim and Jam, along with regular personalized insights, in exchange for a monthly fee.

Existing Solutions / Alternatives

Category	Examples	Limitations in Context
Calorie and Diet Trackers	MyFitnessPal, Lose It	Strong at logging, weak at cultural relevance and contextual advice.
Workout Apps and Programs	Nike Training Club, Freeletics	Often assume access to specific equipment or structured routines.
General AI Assistants	N/A	Can answer health questions, but lack continuity, habit memory, and localized constraints.
Social Media Fitness Influencers	N/A	Highly motivational but inconsistent, non-personalized, and often optimized for aesthetics rather than sustainability.
AI-Assisted Fitness Apps	Fitbod, Fitness AI, Everfit	Overwhelm users with complex features, assume prior knowledge/commitment, and may not be welcoming to beginners.

What Makes This Solution Different

Differentiating Factor	Description
Context-based intelligence and adaptability	Advice is shaped by location, common Filipino food patterns, and realistic access rather than idealized global standards.
Working with constraints	Instead of asking "What's the best diet or workout?" Jim Jam asks, "What can *you* do with what you already have?"
Domain specialization	Separate but cooperative AI agents (Jim for movement, Jam for food) reduce cognitive overload and keep advice focused.
Sustainability over optimization	The app prioritizes habits users can maintain, rather than short-term transformations or extreme plans.
Student-centered economics	Pricing and access models are explicitly designed around student realities, not post-graduate incomes.
Reflection, not just tracking	The "You" dashboard turns raw logs into insights, patterns, and gentle nudges. Not guilt or pressure.

Technologies Used

- **AI / LLMs:** For conversational coaching, pattern recognition, and personalized suggestions.
- **Mobile app framework:** Flutter for cross-platform accessibility.
- **Backend services:** Supabase Database for user profiles, history tracking, and analytics.
- **Third-party integrations:** Strava or similar fitness APIs for activity data.
